Professional Summary

Aspiring Backend Software Engineer with strong foundations in Python, Django, DSA, System Design, and SQL. Builds REST APIs and production-oriented backend services, and works with AI coding agents (Claude Code) to accelerate development and testing. Understands where AI adds value versus where deterministic logic is more reliable.

Education

Vellore Institute of Technology, Bhopal

2022 – 2027

Integrated M.Tech in Artificial Intelligence and Computer Engineering (CGPA: 8.95 / 10)

Technical Skills

Programming: Python, Java, SQL

Backend: Django, FastAPI, REST APIs

Databases: MySQL, PostgreSQL

Core CS: Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks, System Design

AI/ML: LLMs, RAG, LangChain, ChromaDB, PyTorch

Testing: Software Testing Fundamentals, Test Automation Concepts

Tools: Git, GitHub, Docker, Claude Code

Projects

AI-Powered Test Automation Framework (RAG + LLMs)

Dec 2025 – Feb 2026 | [GitHub](#)

- Built an LLM and RAG-powered framework to generate test cases and Selenium scripts from requirements via Flan-T5.
- Chose RAG over full fine-tuning for lower compute cost and faster iteration.
- Developed FastAPI REST APIs for document parsing and semantic retrieval.
- Used ChromaDB to ground outputs in verified requirements, reducing hallucinated test logic.
- Used Claude Code to accelerate API development, debugging, and test scaffolding.

Customer Churn & Conversion Analytics Dashboard | Python, SQL, Power BI

Feb 2026 – Mar 2026 | [GitHub](#)

- Built a Power BI dashboard tracking churn risk, conversion trends, customer retention, and revenue patterns.
- Designed core business KPIs including Recency, Average Order Value (AOV), and repeat purchase / conversion rates.
- Developed custom ETL pipelines using Python and SQL to clean messy logs and segment users by behavior.
- Flagged high-risk churn segments to directly support targeted, conversion-focused marketing campaigns.

CircuitGuard – Visual Defect Detection System | PyTorch, OpenCV

Sep 2025 – Nov 2025 | [GitHub](#)

- Developed a PCB defect detection system achieving **98.34% test accuracy** across 6 defect classes.
- Built OpenCV pipelines for alignment and contour filtering to resolve variable factory lighting issues.
- Developed FastAPI endpoints and automated inference workflows for real-time image validation and report generation.
- Optimized inference speed by applying localized 128x128 ROI cropping to reduce processing latency.

Work Experience

Infosys Springboard Intern

Sep 2025 – Nov 2025

Software Engineering Intern, Remote

- Engineered backend workflows and automated processing pipelines for high-volume data handling.
- Collaborated with mentors and peer engineers to design modular, reusable components, improving software quality and maintainability.
- Optimized processing logic, improving system efficiency and reducing execution overhead.

Google Cloud Generative AI Intern (SmartBridge)

Nov 2025 – Jan 2026

Software Engineering Intern, Remote

- Built cloud-based backend services and API-driven automation solutions using Google Vertex AI.
- Partnered with team mentors to design scalable data pipelines for efficient processing and response generation in GenAI applications.

Achievements

- Top 10 Contributor, SSOC'25.
- Google Cloud Innovator — completed 270+ cloud labs.
- Semifinalist, HackRx 4.0 — built ML-based document forgery detection solution.
- Solved 400+ DSA problems across LeetCode and HackerRank.
